

Vaccination Protocols for Dogs

The C3 vaccination protects dogs against canine parvovirus, distemper virus and hepatitis.

The BBPi and KC vaccinations protect dogs against canine "kennel" cough, which is a requirement for dogs going into kennels. Using these vaccinations in combination with the C3 vaccine is termed a C5 vaccination schedule.

Puppies - 1st vaccination with Durammune C4 at 6-8 weeks +/- Protech Pi2
2nd vaccination with Durammune C4 at 10-12 weeks
+/- Protech Pi2 & Bronchishield Oral

For pups that are 10 weeks or more that require kennel cough vaccination
1st Vaccination Protech Pi2 + Bronchishield Oral
2nd Vaccination Protech Pi2 4 wks later

At 6 mths they will receive a Duramune C4 with or without 1st Proheart inj. These can be given at time of desexing.

Adults – Annual vaccination with single Protech Pi2 + Bronchishield Oral vaccination

Tri-annual booster of Durammune C4 (1st booster due at 3 ½ years) with or without Canine cough booster

Only PARVAC to be used in pregnant bitches
